RESEARCH INTERESTS

Stellar Activity and Ages, Astrobiology, and Time-Domain Astronomy. My research explores three interconnected areas that advance our understanding of life in the universe. I characterize nearby K dwarf stars through spectroscopy to identify older, quieter systems that could host habitable planets. I investigate astrobiology with focus on photosynthesis under non-solar light sources, particularly how life might adapt to K and M dwarf stars. I also conduct optical and radio follow-up of unexplained astrophysical transients to constrain their origin and physical mechanisms.
